Can agricultural water reservoirs be converted to small-scale hydro energy storage sites?

New research from the University of NSW (UNSW) outlines how agricultural water reservoirs could be converted to small-scale hydro energy storage sites to support the uptake of renewable power systems in Australian rural communities.

Could agricultural reservoirs be connected to micro-pumped hydro energy storage systems?

The study, published today in *Applied Energy*, finds agricultural reservoirs, like those used for solar-power irrigation, could be connected to form micro-pumped hydro energy storage systems - household-size versions of the Snowy Hydro hydroelectric dam project.

How can a farm dam be used as energy storage?

As you might have guessed, this solution depends on the size of existing farm dams and rivers, and topography of the land. The steeper the slope between the two water bodies, the more useful the system will be as energy storage. To get the most out of these systems means finding the sites with the most potential value.

Could Australia's farm dams be used to build small-scale hydro energy storage sites?

Can agricultural water reservoirs be used as hydro energy storage sites?

New research is exploring the potential for agricultural water reservoirs to be

utilised as hydro energy storage sites.

Why do farms need battery storage systems?

For farms in remote or off-grid locations, battery storage systems provide a much-needed alternative to unreliable grid power. By combining these systems with renewable energy sources like solar panels, farms can achieve complete energy independence, reducing vulnerability to external disruptions.
