Overview

Can liquid cooling improve AI infrastructure?

- As traditional air-cooled data centers struggle to meet the thermal demands of modern Graphics Processing Units (GPUs), liquid cooling has emerged as a vital solution for sustaining and optimizing AI infrastructure.

What are the benefits of liquid cooling for AI servers?

Liquid cooling servers offer benefits including improved accelerator reliability & performance, increased energy efficiency, reduced water usage, and reduced sound level.² There are two main categories of liquid cooling for AI servers – direct-to-chip and immersion³. There are slight differences in the heat rejection ecosystem that we will cover.

What are the different types of liquid cooling for AI servers?

There are two main categories of liquid cooling for AI servers – direct-to-chip and immersion³. There are slight differences in the heat rejection ecosystem that we will cover. Data center operators and IT Managers unfamiliar with deploying liquid-cooled servers will need to answer a few questions: How do I get cold water in and hot water out?

.

Is liquid cooling the future of data center management?

Liquid cooling is here to stay. With demand for AI and high-performance computing on the rise, data center managers are grappling with how to handle higher heat loads than ever before. At the same time, pressure has increased to drive sustainability, as data centers have begun to be seen as large resource consumers.

How can a liquid cooling system protect AI hardware?

Advanced containment, redundancy, and leak prevention measures are

essential to minimize potential disruptions. Modern liquid cooling systems are engineered to mitigate thermal shock and prevent leaks, thereby safeguarding valuable AI hardware.

How can liquid-to-air technology help a data center?

Liquid-to-air technology can help. Liquid-to-air heat exchangers can help data center managers deploy liquid cooling without relying on facility water by running a closed loop of liquid through racks and then rejecting heat into the air, where it can be managed by existing cooling systems.
