

# Anti-liquid energy storage

## Overview

---

How to design anti-freezing electrolytes for low-temperature aqueous batteries?

Designing anti-freezing electrolytes through choosing suitable H<sub>2</sub>O-solute systems is crucial for low-temperature aqueous batteries (LTABs). However, the lack of an effective guideline for choosing H<sub>2</sub>O-solute systems based on decisive temperature-limiting factors hinders the development of LTABs.

Can ionic liquid electrolytes be used for energy storage devices?

Taking this into consideration, this Review highlights recent advancements in the development and utilization of ionic liquid electrolytes for various energy storage devices, including batteries and supercapacitors. Additionally, this review presents the bibliometric analysis of global research on ILs for energy storage devices from 2019 to 2024.

Which electrolyte enables the extended survival temperature of lithium ion batteries?

Zhang, W. et al. Decimal solvent-based high-entropy electrolyte enabling the extended survival temperature of Lithium-Ion Batteries to  $-130\text{ }^{\circ}\text{C}$ . *CCS Chem.* 3, 1245-1255 (2021). Zhu, K. et al. Inorganic electrolyte for low-temperature aqueous sodium ion batteries.

How to design anti-freezing electrolytes?

This study proposes a general guideline for designing anti-freezing electrolytes by choosing H<sub>2</sub>O-solute systems with low eutectic temperature and strong super-cooling ability, and demonstrates aqueous Na-ion batteries that can operate at the ultralow temperature of  $-85\text{ }^{\circ}\text{C}$ .

Why are ionic liquids used in energy storage?

Ionic liquids (ILs) have attracted considerable attention in energy storage due to their unique properties, including a wide electrochemical stability window

that facilitates their use in high-volt.

How to lower the liquidus temperature of an electrolyte?

Thermodynamically, the liquidus temperature of electrolytes depends on the Gibbs free energy of solid and liquid (Fig. 1a). In order to lower the  $T_f$  of the electrolyte, a decrease in the Gibbs free energy is an essential strategy.

## Anti-liquid energy storage
