Can lithiated nickel manganese cobalt oxide be produced by co-precipitation?

A process model has been developed and used to study the production process of a common lithium-ion cathode material, lithiated nickel manganese cobalt oxide, using the co-precipitation method. The process was simulated for a plant producing 6500 kg day⁻¹.

How much does cobalt cost in 2022?

For example, the price of cobalt has fallen from roughly \$70,000 per metric ton in 2022 to about \$30,000 in 2024. Similarly, the price for lithium carbonate has fallen from a high of approximately \$70,000 per metric ton to well below \$15,000 in 2024.

How is lithium nickel manganese cobalt oxide powder produced?

Schematic of a process for the production of lithium nickel manganese cobalt oxide powder. The product stream, a slurry of solid precipitates in a solution, is phase separated, and then filtered and washed several times. The filtration may be done in a rotary vacuum filter followed by drying in a spray dryer.

How much will NMC cathode material cost?

This combination of changes indicates the possibility of the NMC cathode material price approaching \$20 per kg, or 19% less than the base case scenario. There are yet other cost-cutting measures that can drive the cost down even further. Fig. 6.

Why are nickel-metal hydride batteries expensive?

Nickel-metal hydride batteries exhibit relatively high raw material cost due to large amounts of nickel. These batteries are also subject to commodity price fluctuations of nickel, leading to pack cost of 250 USD/kWh in the worst case.
