When the electric grid has all the energy it needs at a given time, but it's a sunny or windy day and solar and wind energy systems are still generating electricity, batteries help store the surplus. Then, when the sun is down and the wind isn't blowing, batteries can discharge that stored surplus.

Integrating solar batteries with wind power systems presents a compelling solution for enhancing renewable energy efficiency and reliability. This approach allows for the storage of excess energy generated from both solar panels and wind turbines, ensuring a consistent power supply even during.

Increasingly, new solar and wind projects are being paired with Battery Energy Storage Systems (BESS), a development that is helping to overcome one of the biggest challenges facing renewable energy—intermittency. The use of grid-scale storage has become the answer and though in the past this was.
