Gastric lavage (stomach pumping) is a critical medical procedure used to remove toxic substances, undigested pills, or harmful chemicals from the stomach.

What is gastric lavage (stomach pumping)?

Gastric lavage (stomach pumping) is a critical medical procedure used to remove toxic substances, undigested pills, or harmful chemicals from the stomach. While its application has declined with advancements in alternative treatments like activated charcoal, it remains essential in acute poisoning cases.

Does gastric lavage remove gastric contents?

The efficacy with which gastric lavage removes gastric contents decreases with time after ingestion. Gastric lavage should be considered only if a patient has ingested a life-threatening amount of a toxic agent, usually within 1 h or a very few hours previously.

Why is gastric lavage important?

Gastric lavage is especially important at the prehospital stage, as it leads to a decrease in the concentration of toxic substances in the blood. The appearance of a vomiting reflex for certain types of acute poisoning should be considered as a protective reaction aimed at removing the toxic substance from the body.

When should gastric lavage be performed?

Any benefit of gastric lavage would likely be gained if performed promptly and within 1 hour of an oral ingestion. 3 Authors agree that sooner is better. The range of recovered ingested is highly variable at each time point following an ingestion in volunteer and overdose studies.

What are the guidelines for gastric lavage?

Clinical indications and contraindications guide its use. Gastric lavage techniques involve the use of specific equipment, including orogastric or nasogastric tubes. The sequential administration and aspiration method is commonly used. Step-by-step procedure guidelines ensure proper lavage practices.
