

Digital energy storage technology in industrial parks

Overview

Are energy storage systems in industrial parks interoperable?

To address the challenge that existing energy storage systems in industrial parks are not interoperable, leading to difficulties in coordinating energy operations during peak load periods across different energy sources, this paper proposes a DES incorporating the Carnot battery.

Do industrial parks need energy storage?

Existing industrial parks have a high demand for various forms of energy storage but lack the capability to provide comprehensive grid support. There is also an urgent need for DES to actively support the grid as a whole.

Can a Carnot battery convert stored heat to electricity in industrial parks?

Efficiently converting stored heat to electricity in industrial parks remains a significant challenge. The Carnot battery, functioning as both an energy storage system and an electro-thermal integration system, offers a promising solution for DES.

What are the characteristics of industrial parks?

Industrial parks are characterized by varying levels of development, diverse industrial structures, and a high concentration of enterprises, resulting in significant concentrated and concentrated demands for electricity, heat, and other energy sources .

How important is heat & electricity in industrial parks?

According to the IEA's Renewables 2019 Analysis and Forecast to 2024 report, heat accounted for 50 % of global final energy consumption in 2018, underscoring the equal importance of heat and electricity. Efficiently converting stored heat to electricity in industrial parks remains a significant challenge.

What is a hybrid energy storage system?

Hybrid energy storage systems which combine various forms of energy storage, can offer a more robust grid-supporting capability and stability. Grid-supporting capability specifically refers to the ability of the DES to provide active power support to the power grid.
