

# Dual high energy storage new energy

## Overview

---

Considering the high energy density of LIBs and high power density of supercapacitors, a new type of electrochemical system called the hybrid energy storage system was proposed.

Considering the limited theoretical capacity of the  $\text{LiCoO}_2$  cathode and graphite anode, ternary  $\text{LiNi}_{1-x-y}\text{Co}_x\text{Mn}_y\text{O}_2$ .

Fig. 1a and b show the SEM images of the as-prepared Si/C composite in disk morphology with particle size ranging from 10 to 20  $\mu\text{m}$ . The magnified SEM image and TEM image in Fig. 1c.

Here we report a new dual-ion hybrid electrochemical system that optimizes the supercapacitor-type cathode and battery-type anode to boost energy density, achieving an ultrahigh energy density of up to  $252 \text{ W kg}^{-1}$  (under a power density of  $215 \text{ W kg}^{-1}$ ), which is much superior to those of most of the available supercapacitors and dual-ion batteries, and even comparable to those of LIBs. How big will electrochemical energy storage be by 2027?

Based on CNESA's projections, the global installed capacity of electrochemical energy storage will reach 1138.9GWh by 2027, with a CAGR of 61% between 2021 and 2027, which is twice as high as that of the energy storage industry as a whole (Figure 3).

What is the implementation plan for the development of new energy storage?

In January 2022, the National Development and Reform Commission and the National Energy Administration jointly issued the Implementation Plan for the Development of New Energy Storage during the 14th Five-Year Plan Period, emphasizing the fundamental role of new energy storage technologies in a new power system.

How much money did energy storage companies raise in 2022?

In 2022, they accounted for 90% of global energy storage-related fundraising deals (China for 46%, the US for 31%, and Europe for 13% respectively), raising USD 2.9 billion, USD 2 billion, and USD 800 million, respectively (Figure).

What are the application scenarios for energy storage systems?

There is an extensive range of application scenarios for industrial and commercial energy storage systems, including industrial parks, data centers, communication base stations, government buildings, shopping malls and hospitals.

Which country will have the highest energy storage capacity by 2026?

From an international perspective, the IEA estimates that China will have the highest installed electrochemical energy storage capacity by 2026, accounting for 22% of the global total. By then, China will be on a par with Europe and outstrip the US by 7 percentage points (Figure 5). 2.

What are the different types of energy storage technologies?

Depending on how energy is stored, storage technologies can be broadly divided into the following three categories: thermal, electrical and hydrogen (ammonia). The electrical category is further divided into electrochemical, mechanical and electromagnetic (Figure 2).

## Dual high energy storage new energy
