

Energy storage communication protocol interface

Overview

This post will dive into three crucial BMS communication protocols: RS485, RS232, and CAN, explaining how they work, comparing their strengths, and showing how they're used in ONEPOINTECH's industry-leading BMS solutions. Why is internal communication important in energy storage systems?

Efficient internal communication within energy storage systems (ESS) is critical for ensuring stable operation, optimal performance, and safety management.

Which protocol is used between charging station and EVSE?

The protocol can be used between the charging station and EVSE to an Energy Management System (EMS) or DSO for demand response applications, such as forecasted load from tariffs, peak-shaving and reducing grid load. Further on the protocol is presented in Section 2.3.5. Modbus is also another commonly utilized protocol.

What are EV related protocols & interfaces?

An EV related protocol study, conducted by ElaadNL in 2017 shows a thorough analysis of protocols and interfaces used for various EV related applications, such as smart charging, communication between Charging Point Operator (CPO) and central systems (such as Distribution System Operators (DSOs)) .

What protocols does ESS support?

Ethernet interfaces in ESS typically support Modbus and IEC104 protocols, enabling communication with Power Conversion Systems (PCS), internal monitoring devices, and external systems such as SCADA or grid dispatch systems.

What are the communication interfaces for Microgrid Applications?

The protocol is further presented in Section 2.3.1. Other communications

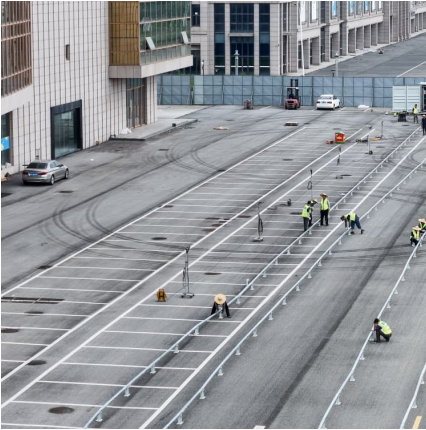

interfaces for microgrid applications are Distributed Network Protocol 3.0 (DNP3) and IEC 61850, as discussed in the study of microgrid communications in [1], which highlights both state of the art and future trends, such as IEC 61850.

How do I expose an IEC 61850 interface?

Exposing an IEC 61850 interface can then be done by using a protocol gateway. Which is responsible of the IED server services, along with the external communication interfaces. Internally, the gateway communicates to the VMS through the proprietary interface. Such communication topology is shown in Figure 4.4.
