

Energy storage deep peak regulation manufacturer

Overview

Do thermal power units provide deep peak regulation?

Specifically, first, the flexibility requirement of renewable integration is quantified, and the operating characteristics of thermal power units providing deep peak regulation are modeled. On this basis, a capacity optimization for BES is proposed considering peak regulation characteristics of thermal power units.

Do I need to charge the energy storage system for peak shaving?

The dispatching department calls it for free. When the output of thermal power unit is between $(1 - k) P_{the}$ and $0.5 P_{the}$, the thermal power unit has the ability for peak shaving. At this time, there is no need to charge the energy storage system for peak shaving. To avoid deep discharge in energy storage system, SOC_{min} is set to 20%.

What is peak shaving of thermal power units?

Considering the operation status and energy consumption characteristics of thermal power units, peak shaving of thermal power units can be divided into conventional peak shaving, deep peak shaving of stable combustion without oil and deep peak shaving with oil .

What is the difference between deep peak regulation and normal peak regulation?

It can be seen that at the phase of deep peak regulation, as the output of units decreases, the cost of thermal power unit continues to increase, which is due to the increased cost of oil input and equipment wear cost. While at the phase of normal peak regulation, the operation cost increases as the power output increases.

Is a capacity optimization for BES based on peak regulation characteristics?

On this basis, a capacity optimization for BES is proposed considering peak

regulation characteristics of thermal power units. Extensive case studies on a modified IEEE system compared and analyzed the impacts of grid integration of different renewable mixes on the power system flexibility from thermal power units and energy storage.

How to meet demand for deep peak shaving in regional power grid?

In order to meet the demand of deep peak shaving in regional power grid, part of thermal power units and condensing thermal power units have been reformed in Northeast China to ensure that thermal power plants can accept dispatching instructions for deep peak shaving. The renovation costs of thermal power units can be formulated as follows:
