

Energy storage plus solar thermal power generation

Overview

What is a thermal energy storage system (PCM)?

In thermal energy storage systems, PCMs are essential for storing energy during high renewable energy generation periods, such as solar and wind. This energy storage capability allows for more efficient supply and demand management, enhancing grid stability and supporting the integration of renewable energy sources .

How does thermal energy storage work?

Thermal energy storage provides a workable solution to this challenge. In a concentrating solar power (CSP) system, the sun's rays are reflected onto a receiver, which creates heat that is used to generate electricity that can be used immediately or stored for later use.

What are the different types of solar energy storage systems?

These include the two-tank direct system, two-tank indirect system, and single-tank thermocline system. Solar thermal energy in this system is stored in the same fluid used to collect it. The fluid is stored in two tanks—one at high temperature and the other at low temperature.

How long does solar energy storage last?

Increasing the solar multiple increases the optimal storage duration to around 10 hours, as thermal energy availability has increased. Using a synthetic fluid typically requires lower price multipliers to achieve a profitable IRR than mineral oils, which is consistent with the above analysis.

How many thermal energy storage items are there in 2024?

The number of items has progressively increased from 6 in 2019 and 2021 to 14 in 2024, indicating growing scholarly attention and advancements in thermal energy storage systems and materials for renewable energy applications. Figure 5 b shows the distribution of items by journal.

Why is thermal storage important for a geothermal/solar hybrid plant?

Thermal storage enables energy from the hybrid plant to be time-shifted to periods in the day where utility market demand and energy rates are higher. The objective of this project is to identify cost-effective thermal storage systems for a geothermal/solar hybrid system in order to increase the plant dispatchability.
