

Energy storage ventilation and explosion relief fan

Overview

Do lithium-ion energy storage stations need a vent panel?

The latest NFPA 855-2023 requires that lithium-ion energy storage stations (Li-BESS) larger than 20 kWh must install explosion protection devices. The vent panel is the preferred protection device for Li-BESS. In this study, the motion equation of the vent panel was derived.

What is the venting efficiency of explosion vent panels?

The venting efficiency of explosion vent panels varies under different explosion intensities. With increasing explosion intensity, the venting efficiency shows a decreasing trend. The venting efficiencies of experimental samples at 13 %, 15 %, 19 %, and 23 % hydrogen concentrations are 83.14 %, 77.80 %, 60.61 %, and 50.36 %, respectively.

How does high explosive power affect venting efficiency?

Therefore, under high explosive power, the internal gas of vessel cannot be vented timely, and the higher reduced explosion pressure leads to lower venting efficiency. The venting efficiency decreases as the increases of vent panel's mass.

Do explosion vent panels reduce explosion overpressure?

With the increasing utilization of explosion vent panels for gas explosion protection, relevant research has begun to emerge. Bauwens conducted experiments on venting hydrogen concentrations ranging from 12 % to 19 % in a rectangular space, analyzing the relationship between venting area and reduced explosion overpressure .

Do explosion power and mass affect Li-Bess vent panels?

To investigate the effect of explosion power and mass on Li-BESS vent panels, the experiment tested the venting efficiency of standard vent panel at four different hydrogen concentrations. Then, four different unit area mass vent

devices were tested under 19 % hydrogen concentration. 4.1. Effect of explosion power.

What are explosion vent panels?

Typically, explosion vent panels are installed above the enclosure of Li-BESS to prevent flames released during venting from causing harm to surrounding equipment and personnel. The number required is determined by dividing the total required venting area by the venting area of a single panel and then dividing by the venting efficiency.
