Overview

What is a thermal energy storage system?

Thermal energy storage system is also simply known as TES tank (thermal energy storage tank). Most people working in the industry prefer to call it TES tank. As for district cooling, they simply called it DCS (district cooling system) or DCP (district cooling plant). TES tanks are usually made of concrete.

How does thermal energy storage work in district cooling?

Thermal energy storage tanks are often found in district cooling systems. They are usually made of concrete and their physical size is big. So, how does it work in district cooling and what exactly is thermal energy storage?

In district cooling, thermal energy storage tanks are used to store cooling energy at night where the electricity is cheaper.

What is a thermal energy storage tank?

In district cooling, thermal energy storage tanks are used to store cooling energy at night where the electricity is cheaper. During the day, the stored cooling energy is released. By doing so, the operating cost of the district cooling plant is reduced.

What are the applications of energy storage systems?

The application for energy storage systems varies by industry, and can include district cooling, data centers, combustion turbine plants, and the use of hot water TES systems. Utilities structure their rates for electrical power to coincide with their need to reduce loads during peak periods.

What are thermal energy storage strategies?

There are two basic Thermal Energy Storage (TES) Strategies, latent heat systems and sensible heat systems. Stratification is used within the tank as a strategy for thermal layering of the stored water. Colder water is denser and

will settle toward the bottom of the tank, while the warmer water will naturally seek to rise to the top.

How does a chilled water storage tank work?

When charging the tank, the warm water is taken from the top of the tank and sent to the chiller, while the chilled water is returned to the tank near the bottom. Chilled water storage tanks require a large footprint to store the large volume of water required for these systems.
