To address this issue, this paper proposes a hybrid energy storage-based power allocation strategy that combines flywheel and battery storage systems to smooth wind power fluctuations and enhance grid acceptance.

Power fluctuations in wind power generation, due to its stochastic and intermittent nature, have become a significant challenge for power system stability and grid integration. To address this issue, this paper proposes a hybrid energy storage-based power allocation strategy that combines flywheel.

Aiming at smoothing wind power fluctuations, this paper proposes a flywheel-battery hybrid energy storage system (HESS) based on optimal variational mode decomposition (VMD). Firstly, the grid-connected power and charging-discharging power of the HESS are determined based on the sliding average.

This article presents the structure of the Flywheel Energy Storage System (FESS) and proposes a plan to use them in the grid system as an energy "regulating" element. The analytical results show the role of FESS and the principle of controlling their operations in the microgrid. Renewable energy is.

Using energy storage technology can improve the stability and quality of the power grid. One such technology is flywheel energy storage systems (FESSs). Compared with other energy storage systems, FESSs offer numerous advantages, including a long lifespan, exceptional efficiency, high power.
