## Overview

---

How do you replace a corresponding variable using a powertransform function?

In practical situations, after estimating a power using the powerTransform function, a variable would be replaced by a simple power transformation of it, for example, if  $\lambda \approx 0.5$ , then the corresponding variable would be replaced by its square root; if  $\lambda$  is close enough to zero, the the variable would be replaced by its natural logarithm.

How do you transform a current source into a voltage source?

Using source transformation, we can change or transform this above circuit with a current power source and a resistor,  $R$ , in parallel, into the equivalent circuit with a voltage source with a resistor,  $R$ , in series, as shown below: We transform a current source into a voltage source by using ohm's law.

What is the source transformation of a circuit?

The source transformation of a circuit is the transformation of a power source from a voltage source to a current source, or a current source to a voltage source. In other words, we transform the power source from either voltage to current, or current to voltage.

What is the function powertransform?

In the car package, we have the function powerTransform which transforms variables in a regression equation to make the residuals in the transformed equation as normal as possible. I am confused about what this transformation is and further in the following example: What I am confused about is what exactly the model p1 is.

How to calculate resistor RA RD?

The resistors  $R_a$ .  $R_d$  may be calculated by using the following formula:  $R = 0.7/\text{cut-of current threshold}$  For example if suppose we want to connect an LED at the output having a current rating of 1 amp. We can set the value of

the corresponding resistor (selected by the jumper) as:  $R = 0.7/1 = 0.7 \text{ ohm}$ .

Do I need a resistor to power a PSU?

Power supplies need a certain minimum load to work properly. The min. load for mine is around 0.8 amps. Thus if you plan on powering LED's or other such low-power device exclusively, you'll need a resistor to provide a load. Otherwise you will damage the PSU. A meaty 10-Ohm, 10 watt resistor from Radio Shack is a good choice.
