

Industrial battery cabinet cost vs benefit calculation in Finland

Overview

The battery cabinets are manufactured by a subcontractor, and therefore all of the data about how the costs are divided between different aspects of the battery cabinets was not available before the start of this thesis.

The battery cabinets are manufactured by a subcontractor, and therefore all of the data about how the costs are divided between different aspects of the battery cabinets was not available before the start of this thesis.

The objective of this Bachelor's thesis was to gather and analyze data about the cost structures of Eaton's EBC-D and EBC-E battery cabinets. The data was used to design a concept for a cost-effective battery cabinet that would replace the two current cabinets. This thesis was commissioned by Eaton.

ed future use of battery solutions. This energy transition is driven by an overall response and alignment towards the climate targets outlined in Paris agreement (COP21) as well as e.g. EU regulatory frameworks¹. In addition, the evolving field of industry 4.0, and small robotized devices dedicated.

This thesis aims to quantify the economic effects of battery degradation and develop an optimization model that maximizes BESS profit while managing degradation over time based on cycle depth. Three operation strategies were evaluated, exclusive participation in Frequency Containment Reserve for.

To better understand BESS costs, it's useful to look at the cost per kilowatt-hour (kWh) stored. As of recent data, the average cost of a BESS is approximately \$400-\$600 per kWh. Here's a simple breakdown: This estimation shows that while the battery itself is a significant cost, the other.

The economic impact of green investments on Finland's national economy is significant, according to a joint study by different industry associations. Finland's gross domestic product (GDP) would be three billion euros higher annually if just one-fifth of the green investment projects listed in the. Should Finnish companies integrate battery technology into their industrial base?

e solutions for harsh environments. Finnish companies are constantly

integrating battery technologies as part of their overall solutions and should continue to integrate such solutions into its industrial base. There exists high-level expertise related to chemicals and processing especially.

Why is Finland a good choice for next generation batteries?

Finland is strong in applications related to harsh environments, e.g. marine and heavy-duty that are traditionally strong Finnish industry segments. Solutions for energy storage.

Is Finland a good place to invest in a battery industry?

Some interviewees working outside of the materials part of the Li-ion battery value chain mentioned that the battery industry business is still very small and limited in Finland, even compared to other European countries, which affects the attractiveness of Finland as an operational environment.

Should the Finnish lithium-ion battery industry be regulated?

When it comes to waste lithium-ion batteries, the Finnish regulatory and legal environment should be harmonized with that of other European countries.

Should Finland ensure the existence of a lithium-ion battery ecosystem?

It is clear that Finland should assure the existence of these competences in the future. The role of GTK and its vast geoscientific data plays an important role in this, and not only regarding the current Li-ion battery boom but also in the future when different minerals are required.

How important is research in Li-ion battery production in Finland?

Research in the field is also minor compared to e.g. Germany, where there are hundreds of researchers dedicated to Li-ion batteries. Knowledge transfer with Asian research organizations and universities is considered important, because Li-ion battery research and industry experience in Asia is
