

# Kosovo buffer storage tank

## Overview

---

How does a buffer storage tank work?

The principle of operation of a buffer storage tank is based on the high heat capacity of water. For example, 1 liter of water cooled by 1°C can heat 1 m<sup>3</sup> of air by 4°C. The buffer storage tank is designed to collect and store heat for later use in heating or domestic hot water systems.

What is a buffer tank in a heating system?

The principle of a buffer tank in a heating system is to store heat and use it later when demand is higher or energy availability is favorable. Here are the basic principles of buffer tank operation in a heating system: Heat accumulation. Heating system thermal storage tanks come into operation when excess heat is generated.

How do you calculate a buffer storage tank?

In hot water supply systems with a given high peak consumption of hot water and heating of this water by a low-power source during the day (such a scheme is used in baths). Calculation of the buffer storage tank consists of determining the accumulative capacity of the stored volume of water.

Who should choose a buffer storage tank?

The priority in selecting a buffer storage tank will be the consumer, if it is necessary to cover a given heat load in a certain time, for example: In heating systems in which the source of heat is an electric boiler that works only during the reduced night tariff.

What are the basic principles of buffer tank operation in a heating system?

Here are the basic principles of buffer tank operation in a heating system: Heat accumulation. Heating system thermal storage tanks come into operation when excess heat is generated. For example, from heat production processes or from solar panels.

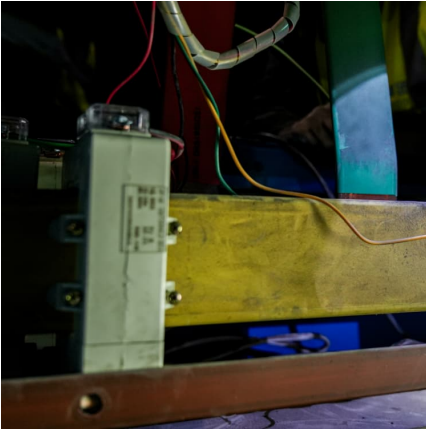

How much heat is removed from a buffer storage tank?

When removing heat and cooling the tank by 50°C, 0.05 Gcal of heat will be removed from it, respectively. Depending on the application scheme, different methods of calculating buffer storage tanks are used, but in general, the following should be taken into account when choosing:
