

Locomotive battery energy storage solution design

Overview

What is a locomotive battery?

1. Introduction The battery is the electric energy storage unit of locomotive and its vehicles, which is the key component to ensure the start of the diesel engine, auxiliary circuit operation, and locomotive standby power supply. In recent years, the application of new energy equipment in the field of rail transit is on the rise [1].

How much weight can a locomotive power battery system reduce?

The research results provide a new concept for the design of a locomotive power battery system. (5) The weight of the optimized scheme is 2020 kg, and the original scheme is 2470 kg; thus, the reduction in weight is 450 kg.

Who designed the battery system for a hybrid shunting locomotive?

In the design of a hybrid shunting locomotive, Bin Liu [15] designed the lithium titanate battery system, which effectively reduced the harmful impact of the high temperature issued by the diesel engine under the normal operation of the battery pack. Jiaying Xie [16] designed the water cooling system for the battery.

What happens if a power battery is exposed to a locomotive?

As the power battery system is exposed to the locomotive body, the under-vehicle equipment will be damaged by rain, sand, silt, and debris along the locomotive, and wading will be encountered under extreme conditions. After the cell is formed, each electrode is in a semi-sealed state.

What is a locomotive traction system?

The function is to provide a continuous traction power supply for the locomotive. The total energy of the system is 300 kW·h and the total voltage is 547 V. The system is installed close to the locomotive running section bogie, and mounted on the lower part of the body.

What is the operating temperature of a locomotive?

According to the locomotive design scheme, the operating ambient temperature of the locomotive is within the range of $-25\sim 45\text{ }^{\circ}\text{C}$, and the operating temperature of the battery selected in this study ranges from $-40\text{ }^{\circ}\text{C}$ to $85\text{ }^{\circ}\text{C}$, the maximum temperature is above $45\text{ }^{\circ}\text{C}$, and the minimum temperature is below $-25\text{ }^{\circ}\text{C}$.
