

# Onboard energy storage circuit

## Overview

---

What type of energy storage system is used for onboard utility?

The most commonly used ESS for onboard utility are battery energy storage systems (BESS) and hybrid energy storage systems (HESS) based on fuel cells (FC) [12, 13, 14]. Modern BESS for onboard utility can be classified into two groups of batteries: lead-acid and Lithium-Ion (Li-Ion).

What are on-board energy storage devices (HESDs)?

As an emerging technology, on-board HESDs are usually composed of different types of energy storage devices, namely, batteries (BATs), supercapacitors (SCs), and flywheels, where the hybridization solutions to BATs and SCs are widely applied in electric vehicles and rail transportation [ 5, 6 ].

How can energy storage systems be optimally selected?

Another aspect that should be looked into to achieve an optimal selection, dimensioning, and management of energy storage systems is the perspective of economic generation and utilisation of electricity for onboard power systems. One of the proposed methods was presented in .

Are on-board HESDs effective for energy-saving operations?

Although the integration of on-board HESDs in the traction system are considered to be an important and effective method for energy-saving operations, the energy-saving performance can be greatly affected by other factors.

How to optimize the energy-saving operation of electric trains?

The optimal energy-saving operation of electric trains under the different operating conditions of on-board HESDs can be located, where the corresponding train speed trajectory, power split of on-board HESDs and the solution of minimum net energy consumption (NEC) are all obtained.

What is the topology of the connection between container energy storage elements?

The topology of the connection between container energy storage elements and the onboard grid. The maximum number of connected containers is determined by many parameters resulting from the system design. For example, one such parameter is the maximum power for which the DC/DC converter connected to the stack will be designed.

## Onboard energy storage circuit
