## Overview

How is compressed air stored in a heat exchanger?

The clean and dry air is compressed in three stages and cooled three times via heat storage media. Then, the compressed air enters the CST through valve V1 and into heat exchanger HE11 through valve V2 successively, is cooled and liquefied due to the absorption of cold energy, and is finally stored in the liquid air tank (LAT).

How efficient is a liquid air energy storage system?

The round-trip efficiency  $\eta$  RTE of the proposed liquid air energy storage system is 0.592, which is relatively high compared with those of the standalone liquid-air energy storage systems in previous studies. The total input power  $\sum W$  in and total output power  $\sum W$  out are 1654.64 kW and 979.76 kW, respectively.

Can a liquid air energy storage system replenish liquefaction capacity?

In this paper, a novel liquid air energy storage system with a subcooling subsystem that can replenish liquefaction capacity and ensure complete liquefaction of air inflow is proposed because of the inevitable decrease in the circulating cooling capacity during system operation.

What is liquid air energy storage?

Among the existing solutions, liquid air energy storage (LAES), an emerging concept in thermomechanical energy storage, has become a particularly attractive option for addressing such energy storage needs and for storing electrical energy in the form of liquid air in the cryostate.

Where does the cold energy used to liquefy compressed air come from?

The cold energy used to cool and liquefy the compressed air originates from that released when the liquid air in the previous cycle is vaporized and stored in the cold storage equipment during the liquefaction process of a standalone

LAES system.

What is the exergy of air entering the system?

For charging and discharging, the exergy of the air entering the system from the environment in the reference state is determined to be zero.
