

Phase change energy storage refrigerator

Overview

This technology is a novel household refrigerator that uses advanced evaporators with phase change material (PCM)-based long-duration cold energy storage, PCM heat conduction enhancement using a metal foam material, direct-contact defrosting technology, and a low.

This technology is a novel household refrigerator that uses advanced evaporators with phase change material (PCM)-based long-duration cold energy storage, PCM heat conduction enhancement using a metal foam material, direct-contact defrosting technology, and a low global warming potential (GWP).

The objective is to develop a novel household refrigerator that uses advanced evaporators with phase change material (PCM)-based, long-duration cold energy storage and a low-global warming potential alternative refrigerant to achieve flexible load demand management and transformational efficiency.

This technology is a novel household refrigerator that uses advanced evaporators with phase change material (PCM)-based long-duration cold energy storage, PCM heat conduction enhancement using a metal foam material, direct-contact defrosting technology, and a low global warming potential (GWP).

An innovative compartmentalized phase-change cold storage refrigerator has been proposed in this study, designed to address the increasing demand for efficient and energy-saving solutions in the cold chain transportation industry. A conceptual module prototype is designed and built in this study.

Among them, phase change material (PCM) is a novel approach, which seeks the attention of researchers for improving the energy efficiency and performance of the system. A PCM is a substance that can store or discharge

a large amount of heat energy by changing its phase. Hence, the integration of.

the phase-change cold storage technology to refrigerated transportation to reduce the energy consumption. Experiment data showed that the electronic expansion valve can be randomly adjusted to simulate the temperature within negative 25 °C to negative 5 °C, and a system for defrosting at low.
