How to design a superconducting system?

The first step is to design a system so that the volume density of stored energy is maximum. A configuration for which the magnetic field inside the system is at all points as close as possible to its maximum value is then required. This value will be determined by the currents circulating in the superconducting materials.

What are superconductor materials?

Thus, the number of publications focusing on this topic keeps increasing with the rise of projects and funding. Superconductor materials are being envisaged for Superconducting Magnetic Energy Storage (SMES). It is among the most important energy storage systems particularly used in applications allowing to give stability to the electrical grids.

Are new materials a powerful energy storage system?

Abstract With the increasing demand for energy worldwide, many scientists have devoted their research work to developing new materials that can serve as powerful energy storage systems. Thus, the number of publications focusing on this topic keeps increasing with the rise of projects and funding.

When was superconducting invented?

The first superconducting application has been implemented in 1980 by the Bonneville Power Authority in U.S.A to attenuate the low frequency [ 80, 87 ]. This device has successfully operated over a year with 1200 h of energy transfer which corresponds to  $10^6$  cycles for the magnet.

Is superconducting magnetic energy storage a source impulsionnelle?

A. Badel, Superconducting magnetic energy storage haute temperature critique comme source impulsionnelle. Supraconductivité [cond-mat.supr-con]. Institut National Polytechnique de Grenoble-INPG, (2010). Français.
