

Structural characteristics of superconducting energy storage system

Overview

Superconducting magnetic energy storage (SMES) systems are created by the flow of current in a coil that has been cooled to a temperature below its critical temperature. This use of superconducting coils to store magnetic energy was invented by M. Ferrier in 1970. A typical SMES system includes three parts: superconducting coil, power conditioning system and cryogenically cooled refrigerator.

A typical SMES system includes three parts: superconducting coil, power conditioning system and cryogenically cooled refrigerator. Once the superconducting coil is energized, the current will not decay and the magnetic energy can be stored indefinitely.
