

Swedish thermal power storage power station standards

Overview

What is thermal energy storage?

Thermal energy storage is a broad field of research in the context of renewable energy technologies. Today, two-tank molten salt storage is commonly used, but there are other more cost-efficient storage options being developed.

How much power does Sweden have?

The total installed CHP capacity excluding industrial CHPs in Sweden is 3528 MW of electrical power, where the common fuels are biomass and household waste, but a small fraction of fossil natural gas is also present.

Should HTS be implemented in Swedish CHP plants?

When the hydroelectric power plants are not able to balance the extensive variable renewable electricity, implementing HTS into the Swedish CHP plants indicates an opportunity to avoid about 53% of the curtailment from wind and solar power that would otherwise be necessary, and to replace about 21% of the fuel in the CHP plants.

How much wind and solar power does Sweden produce a year?

The annual wind and solar power production was 17 TWh and 79 GWh respectively. In the simulation a Swedish electricity production system with decommissioned nuclear power has been considered, compensated for by a greatly increased amount wind and solar power. The wind and solar capacity are assumed to be roughly 5 and 100 times larger respectively.
