

# Thermal energy storage device industry analysis

## Overview

---

Analysis of thermal energy storage (TES) for decarbonization of industrial heating processes & wider markets (LDES, CSP), including technologies (molten salt, solid-state, PCM, electro-thermal, thermochemical), players, projects, initiatives, & forecasts. What is thermal energy storage?

Shifting consumer preference toward adaptive, efficient, and durable centralized cooling system have urged the deployment of thermal energy storage across the HVAC applications. Moreover, the thermal energy storage technology is being widely used for comfort cooling owing to growing demand for climate-controlled buildings.

How does a thermal energy management system work?

By storing and managing thermal energy, TES systems contribute to balancing the daily, weekly, and seasonal variations in energy demand and supply.

Why do European cities need a thermal energy storage system?

Europe has been installing various thermal energy storage systems for a decade in the urban districts of countries like Spain, Austria, and Northern and Central Europe. The major driver of such a strategic step is the high energy consumption during winters and exploring renewable ways of district heating.

What is a thermal energy plant?

Thermal energy plants are utilized to generate electrical energy to suffice the energy demand of the residential and commercial sectors. Electrical storage heaters and home storage units are also employed to store thermal energy in order to provide residential and commercial buildings with heating and cooling capacity as required.

What is sun2store thermal energy storage?

In January 2022, the European Union and the European Investment Bank chose Malta Inc., the grid-scale thermal energy storage provider, to execute

the Sun2Store thermal energy storage project in Spain. It is a 1,000-MWh/ten-hour energy storage system combining pumped heat technology with molten salt.

What is a thermal energy segment?

The segment comprises public services, such as broadband internet, transportation, telephone, sewage, water, natural gas, and electricity. Thermal energy is utilized to provide these public services at an extremely low cost. Cogeneration plants are employed to derive thermal energy and then convert it to the required form of energy.
