

Truck energy storage capacity

Overview

How do you calculate dormancy in a truck fuel cell?

Dormancy calculations assume that the vessels are pressurized to 3 bar (system S1), 4 bar (S2) and 5 bar (S3) at the moment when the truck fuel cell is shut down. Fig. 5. LH 2 storage system performance. Figure shows volume and capacity values per vessel. Multiply by 2 to obtain total for the truck.

How does battery density affect LD delivery trucks & HD semi-trailers?

An increase in the battery energy density is also beneficial for the TCO and life-cycle CO₂ of LD delivery trucks and HD semi-trailers (Fig. 4) by effectively decreasing the replacement rate. Only with an increase in the battery density can the electric LD delivery truck fleet receive both cost and CO₂ advantages over DTs.

How far do electric semi-trailers and dump trucks run?

The real-world data indicated that electric semi-trailers and dump trucks ran, respectively, 372 km and 158 km on average, equivalent to 69% and 75% of the levels of the respective DT fleets. The reasons for the underusage of ETs included the limited battery capacity, range anxiety and different task assignments compared with DTs.

How much storage capacity does a LH 2 storage system have?

The amount of stored H₂ greatly exceeds the study goal of 60 kg system capacity. The LH 2 storage system offers an autonomy of 539–621 miles while fueling a 275-kW hybrid fuel cell system that provides propulsion power to a Class-8 long haul truck driven on a representative duty cycle.

How many dormancy targets can a fuel cell supply?

Systems S1 and S2 are equipped with on-board LH₂ pumps capable of supplying H₂ to fuel cell at 5 bar and 8 bar, respectively. System S3 is capable of supplying H₂ to fuel cell at 5 bar without an on-board LH₂ pump.

For each system configuration, three dormancy targets (1, 2, and 3 days) are considered. Table 3.

How many km a day does a diesel delivery truck run?

LD diesel delivery trucks could run approximately 200 km per day on average. The average daily mileage of electric delivery trucks was merely 109 km. For the HD segment (GVW > 12 t), semi-trailers and dump trucks shared the largest stock number of ETs.
