Overview

What is energy storage system (EMS)?

If we liken the energy storage system to the human body, EMS acts as the brain, determining the tasks performed, establishing reasonable work and rest patterns, and enabling self-protection in case of accidents. Different demands exist for EMS in source-grid side energy storage and industrial and commercial energy storage:.

What is Energy Management System (EMS)?

However, if energy storage is to function as a system, the Energy Management System (EMS) becomes equally important as the core component, often referred to as the 'brain.' EMS is directly responsible for the control strategy of the energy storage system.

What devices need to be connected to EMS?

Although industrial and commercial energy storage has relatively small capacities, it involves numerous devices that need to be connected to EMS, including PCS (Power Conversion System), BMS (Battery Management System), air conditioners, electric meters, intelligent circuit breakers, fire control hosts, sensors, and indicator lights, among others.

Why should you choose a battery based energy storage system?

By sourcing batteries separately, users can expand their energy storage capacity as needed without overhauling the entire system. This scalability makes it an ideal solution for both residential and light commercial applications, future-proofing investment and enabling smart energy management.

How does EMS integrate with the cloud platform?

To facilitate bidirectional data flow between the energy storage station and the cloud platform, EMS must integrate seamlessly at the system layer,

ensuring real-time and lossless reporting of station-side data to the cloud platform. Similarly, instructions from the cloud platform should be transmitted to the station securely and in real time.

How often should EMS collect data?

Relevant protection measures require EMS to collect data at least once every second. Cloud and Edge Integration: To facilitate bidirectional data flow between the energy storage station and the cloud platform, EMS must integrate seamlessly at the system layer, ensuring real-time and lossless reporting of station-side data to the cloud platform.
