Batteries are perhaps the most recognized form of electrical energy storage components. These devices work by converting chemical energy into electrical energy through electrochemical reactions.

Energy can be produced and used in a variety of types in the electricity markets, each having its own storage system. ESSs enjoy specific technologies that can be discussed in terms of various aspects such as structure, charge and discharge, life cycle, reliability, size, and cost.

Whether in the form of batteries, pumped hydro, or other technologies, energy storage systems provide the flexibility needed to ensure reliable, sustainable, and on-demand energy for homes, businesses, and industries.

At the most basic level, an individual battery cell is an electrochemical device that converts stored chemical energy into electrical energy. Each cell contains a cathode, or positive terminal, and an anode, or negative terminal.
